

Lab Assignment # 07

Course Title : **AI Assistant Coding**
Name of Student : **BG.Sreevani**
Enrollment No. : **2303A54066**
Batch No. : **48**

Lab 7: Error Debugging with AI: Systematic approaches to finding and fixing bugs

Task 1 (Mutable Default Argument – Function Bug)

Task: Analyze given code where a mutable default argument causes unexpected behavior. Use AI to fix it.

Prompt: “explain the bug, and provide a corrected version that avoids this issue”

Expected Output:

Corrected function avoids shared list bug

Output Screenshot:

The screenshot shows a code editor with a file named `lab7.py`. The code defines a function `add_item(item, items=None)`. Inside the function, it checks if `items` is `None`, and if so, it initializes `items` as an empty list `[]`. Then it appends the `item` to the list and returns it. The code then prints the result of `add_item(1)` and `add_item(2)`. A comment at the bottom of the code states: `#The error in the code is that using a mutable default argument (like a list) can lead to unexpected behavior because the same list object is shared`. The output window at the bottom shows the execution results: `[1]` and `[2]`. The status bar at the bottom indicates the file is at line 10, column 494, using UTF-8 encoding, and the Python version is 3.13.12 (Microsoft Store).

```
1 #fix the mutable default argument bug in the code below and explain the error
2
3 def add_item(item, items=None):
4     if items is None:
5         items = []
6         items.append(item)
7     return items
8 print(add_item(1))
9 print(add_item(2))
10 #The error in the code is that using a mutable default argument (like a list) can lead to unexpected behavior because the same list object is shared

Task 15 (Type Error – Input Treated as String Instead of Number)

Task: Fix code where user input is not converted properly.

Prompt: fix the code and explain the error

Bug: Input remains string

```
def sum_two_numbers():
    a = input("Enter first number: ")
    b = input("Enter second number: ")
    return a + b
print(sum_two_numbers())
```

Requirements:

- Explain why input is always string.
- Fix using int() conversion.
- Verify with assert test cases.

Output Screenshot:

The screenshot shows a Visual Studio Code editor with a file named `lab7.py` open. The code is a Python script that defines a function `sum_two_numbers()` which takes two inputs, converts them to integers, and returns their sum. It includes several assertions and a comment explaining the need for `int()` conversion. The terminal at the bottom shows the command to run the script, a `KeyboardInterrupt` message, and the execution output where the user enters 7 and 8, resulting in 15.
